

Test ID	What was being tested	Nature of the failure	Error in the code / test	Action taken to fix it
TC-W03	Standard withdrawal limit (\$500)	Transaction was accepted for \$501.00	Missing conditional check for session_mode == "standard" in withdrawal handler	Added if amount > 500 constraint check in handle_withdrawal()
TC-W04	Withdrawal balance constraint	Transaction processed even if it would drop balance below \$0	Prototype did not cross-reference requested amount against current account balance	Implemented validate_account() to check existing balance before logging
TC-T02	Standard transfer limit (\$1000)	Transfer of \$1001.00 was incorrectly logged to the .atf file	Missing logic to enforce the \$1000 session limit for non-admin users	Added conditional logic to handle_transfer() to reject amounts > \$1000
TC-C02	Create Account privilege check	Standard user was able to access the 'create' command	The routing logic in main.py did not verify session.mode == "admin" before calling the function	Restricted the create command to admin sessions only
TC-GEN01	Disabled account access	Transactions were permitted on an account with status 'D'	The initial front-end did not parse the status field (index 27) from the accounts file	Updated load_accounts() to store account status and added a check in validate_account()
TC-W02	Admin withdrawal	Actual output was an error message instead of a transaction	The test case attempted a \$5000 withdrawal from an account with only \$100, triggering an NSF error	Updated TC-W02.txt to a valid amount (\$50) and adjusted expected .atf to match
